Introduction to Information Retrieval

CS276: Information Retrieval and Web Search Lecture 19: Web Question Answering

Web Search in 2020?

The web, it is a changing.

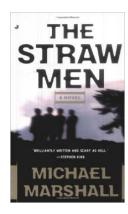

What will people do in 2020?

- Type key words into a search box?
- Use the Semantic Web?
- Speak to your computer with natural language search?
- Use social or "human powered" search?

Getting information

The common person's view? [From a novel]

"I like the Internet. Really, I do. Any time I need a piece of shareware or I want to find out the weather in Bogota ... I'm the first guy to get the modem humming. But as a source of information, it sucks. You got a billion pieces of data, struggling to be heard and seen and downloaded, and anything I want to know seems to get trampled underfoot in the crowd."

Michael Marshall. *The Straw Men.* HarperCollins, 2002.

"Information retrieval"

- The name "information retrieval" is standard, but as traditionally practiced, it's not really right
- All you get is document retrieval, and beyond that the job is up to you

What do we know that's happening?

 Much of what is going on is in the products of companies, and there isn't exactly careful research explaining or evaluating it

Google

What's been happening? 2014–2015

- "Mobilegeddon" (Apr 21, 2015):
 - "Mobile friendliness" as a major ranking signal
- "Pigeon" update (July 2014):
 - More use of distance and location in ranking signals
- "App Indexing" (Android, iOS support May 2015)
 - Search results can take you to an app
- Why?
 - About half of all searches are now from mobile
 - Making/wanting good changes, but obvious self-interest in trying to keep people using mobile web rather than apps

Google

What's been happening? 2014

- New search index at Google: "Hummingbird"
 - <u>http://www.forbes.com/sites/roberthof/2013/09/26/google-just-revamped-search-to-handle-your-long-questions/</u>
- Answering long, "natural language" questions better
 - Partly to deal with spoken queries on mobile
- More use of the Google Knowledge Graph
 - Concepts versus words

What's been happening

- Google Knowledge Graph
- Facebook Graph Search
- Bing's Satori
- Things like Wolfram Alpha

Common theme: Doing graph search over structured knowledge rather than traditional text search

What's been happening

- More semi-structured information embedded in web pages
 - schema.org

TENNIS						

After Nadal and Ferrer, Spanish Tennis Talent Pool Looks Thin

JUNE 2, 2014

What's been happening

- Move to mobile favors a move to speech which favors "natural language information search"
 - Will we move to a time when over half of searches are spoken?

Towards intelligent agents

Two goals

- Things not strings
- Inference not search

Two paradigms for question answering

- Text-based approaches
 - TREC QA, IBM Watson
- Structured knowledge-based approaches
 - Apple Siri, Wolfram Alpha, Facebook Graph Search

(And, of course, there are hybrids, including some of the above.)

At the moment, structured knowledge is back in fashion, but it may or may not last

Example from Fernando Pereira (GOOG)

Entity disambiguation and linking

- Key requirement is that entities get identified
 - Named entity recognition (e.g., Stanford NER!)
- and disambiguated
 - Entity linking (or sometimes "Wikification")
 - e.g., Michael Jordan the basketballer or the ML guy

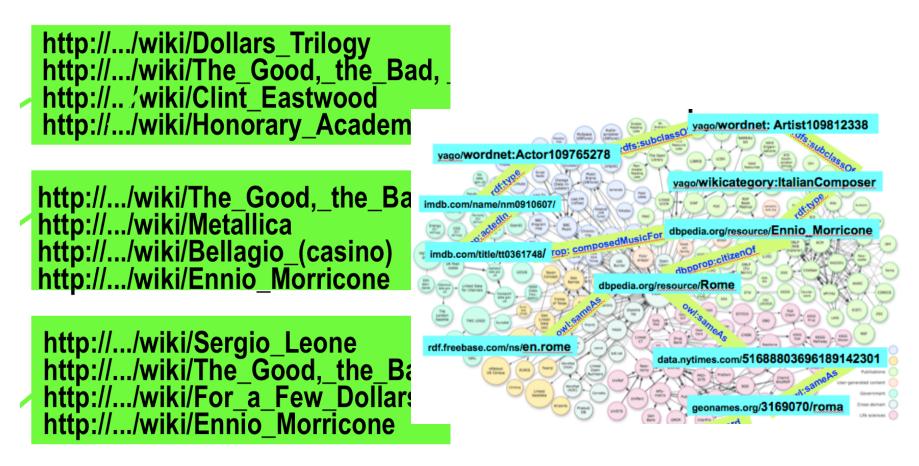

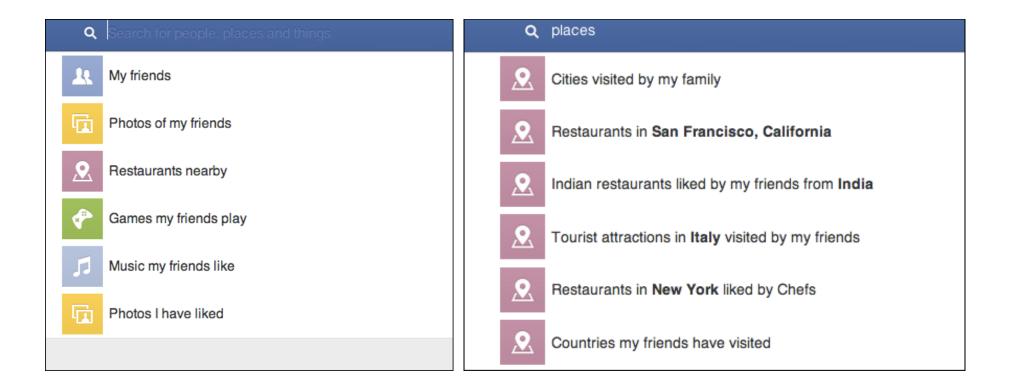

and linked to a canonical reference

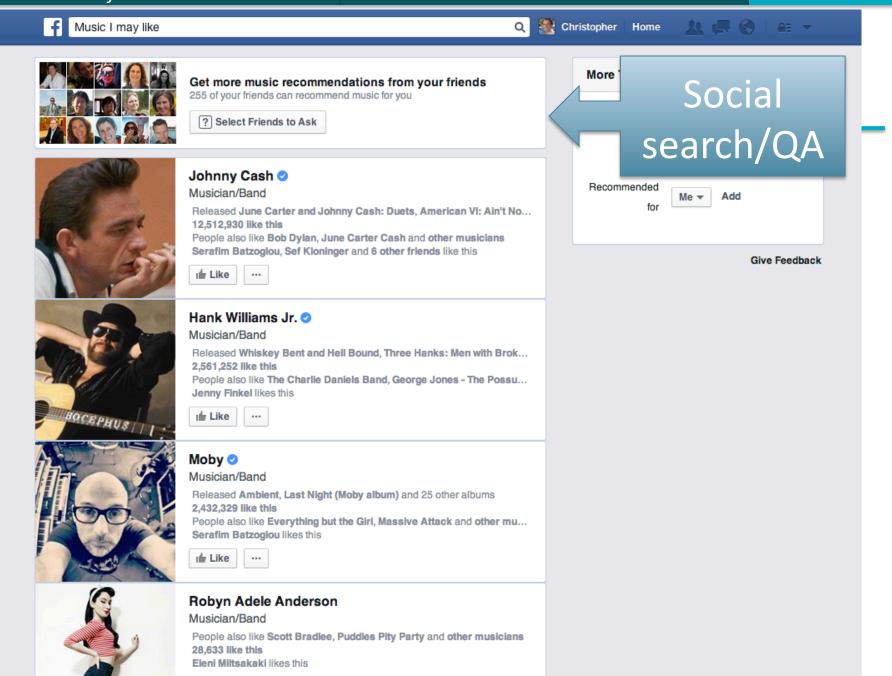

Freebase, dbPedia, Yago2, (WordNet)

Facebook Graph Search

Introduction to Information Retrieval

The Facebook Graph

- Collection of entities and their relationships
 - Entities (users, pages, photos, etc.) are nodes
- Relationships (friendship, checkins, tagging, etc.) are *edges*
- Nodes and edges have metadata
- Nodes have a unique id the *fbid*

Facebook Graph Snippet

fbid: 213708728685 type: PAGE name: Breville mission: To design the best ...

FRIEND

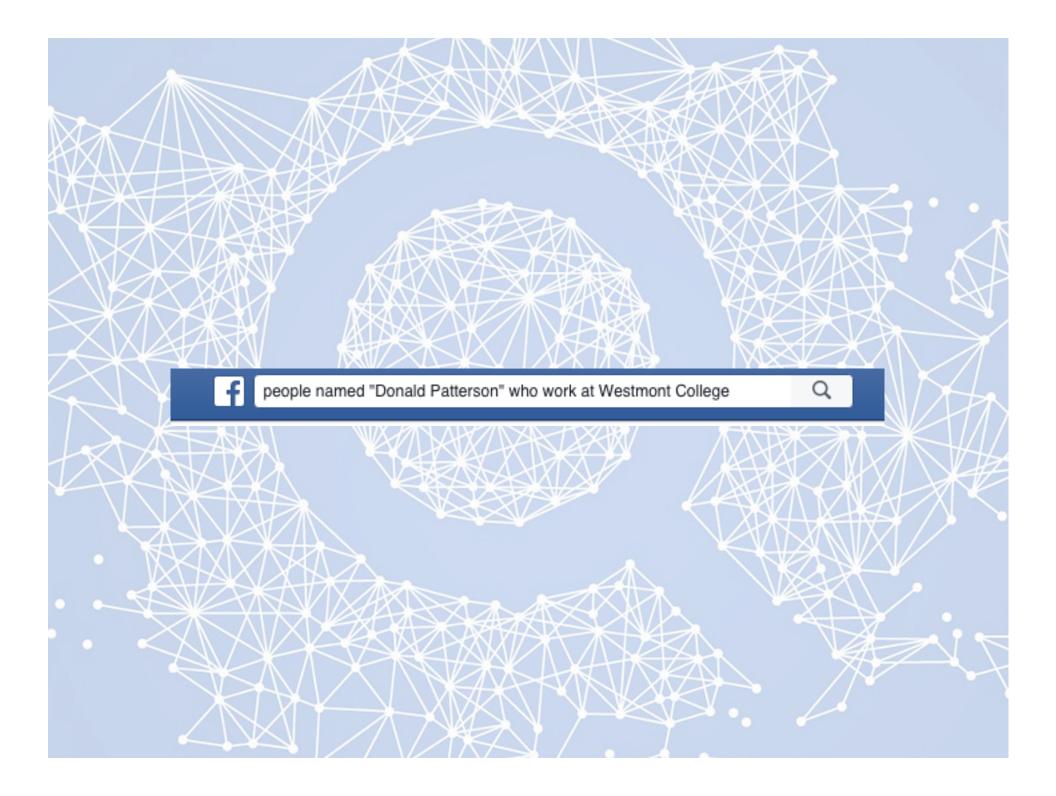

TAGGED

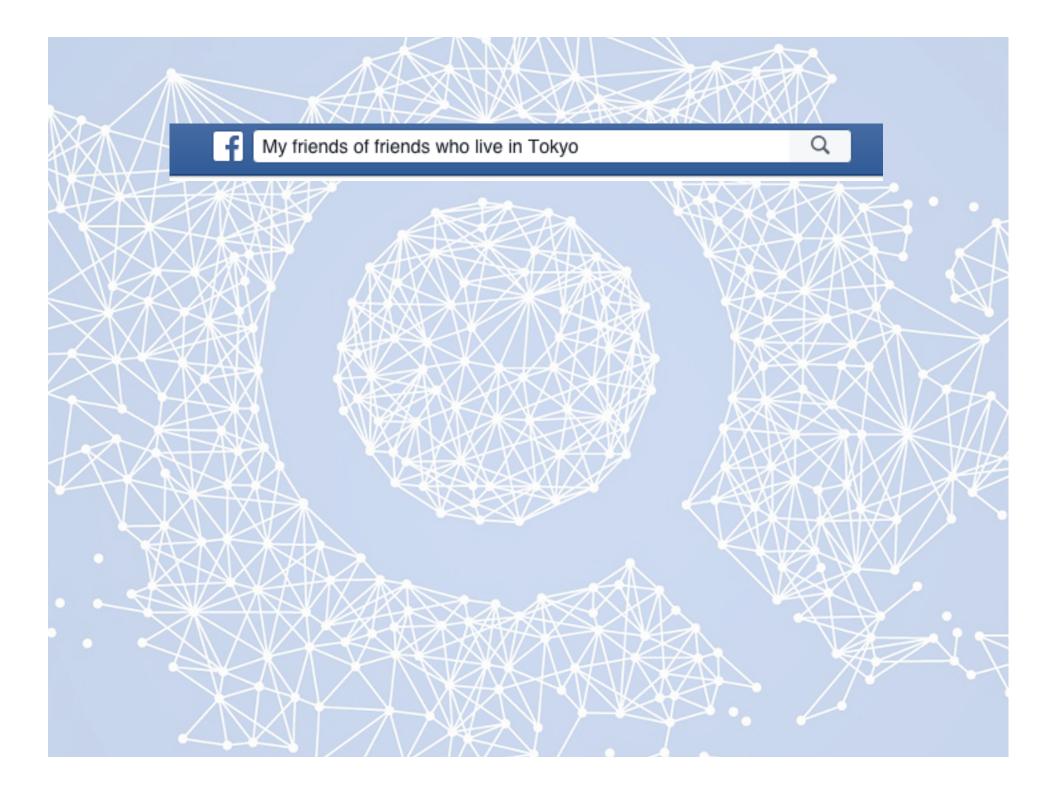

PHOTO

fbid: 586206840 type: USER name: Sriram Sankar

...

LIKES

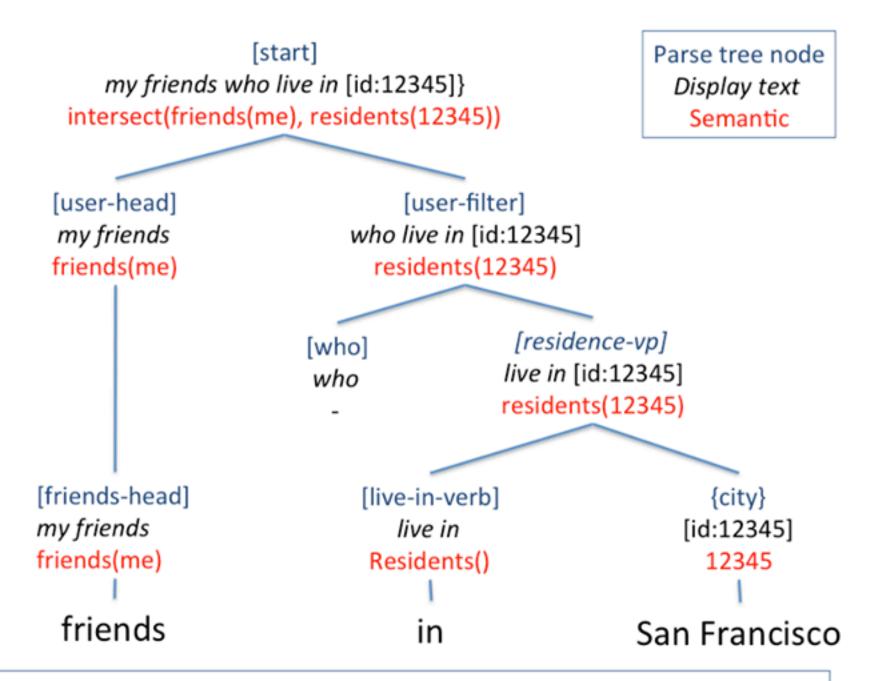

Facebook Graph Search

 Uses a weighted context free grammar (WCFG) to represent the Graph Search query language:

•	[start] => [users]	\$1
•	[users] => my friend	friends(me)
•	[users] => friends of [users]	friends(\$1)
•	[users] => {user}	\$1
•	[start] => [photos]	\$1
_		

- [photos] => photos of [users] photos(\$1)
- A terminal symbol can be an entity, e.g., {user}, {city}, {employer}, {group}; it can also be a word/phrase, e.g., friends, live in, work at, members, etc. A parse tree is produced by starting from [start] and expanding the production rules until it reaches terminal symbols.

The parse tree, semantic and entity ID used in the above example are for illustration only; they do not represent real information used in Graph Search Beta

third prime minister of Australia

Australia's third prime minister

Australia's 3rd prime minister

3 approaches to question answering: Knowledge-based approaches (Siri)

- Build a semantic representation of the query
 - Times, dates, locations, entities, numeric quantities
- Map from this semantics to query structured data or resources
 - Geospatial databases
 - Ontologies (Wikipedia infoboxes, dbPedia, WordNet, Yago)
 - Restaurant review sources and reservation services
 - Scientific databases
 - Wolfram Alpha

Text-based (mainly factoid) QA

- QUESTION PROCESSING
 - Detect question type, answer type, focus, relations
 - Formulate queries to send to a search engine
- PASSAGE RETRIEVAL
 - Retrieve ranked documents
 - Break into suitable passages and rerank
- ANSWER PROCESSING
 - Extract candidate answers (as named entities)
 - Rank candidates
 - using evidence from relations in the text and external sources

Hybrid approaches (IBM Watson)

- Build a shallow semantic representation of the query
- Generate answer candidates using IR methods
 - Augmented with ontologies and semi-structured data
- Score each candidate using richer knowledge sources
 - Geospatial databases
 - Temporal reasoning
 - Taxonomical classification
